API specification

Endpoint

POST `https://api.nanok.ai/inference/caries`

Headers

- `ApiKey`: <API_KEY>

Request Parameters

- **`modelName`** *(String)*: Name of the model to use.
- **`image`** *(File)*: Image file to analyze, must be JPG, JPEG, or PNG.

Response

200 OK

```
{
  "traceId": "6c9a3fd0-2e19-44ab-bbc8-3f6f8e0dc645",
  "ok": true,
  "error": null
  "value": {
    "tensors": [
      {
        "id": 1,
        "coordinates": [379, 252, 418, 297],
        "confidence": 0.6485,
        "classification": "DENTINE"
      },
      {
        "id": 2,
        "coordinates": [594, 256, 657, 342],
        "confidence": 0.6069,
        "classification": "ENAMEL"
      }
    ]
  }
}
```

How to use

To use this API you need to get the `ApiKey` and the `modelName`.
Both properties can be found by navigating to your organization's page.
Generate an `ApiKey` from the **API Clients** panel, click "Add new". Make sure to copy the key to a safe place, it will only be shown once.
Get the `modelName` from the **Available models** panel.

Example cURL request:

```
curl -X POST "https://api.nanok.ai/inference/caries" \
      -H "ApiKey: ey..." \
      -H "Accept: application/json" \
      -F "modelName=demo" \
      -F "image=@/Users/cool_dentist/Documents/x_ray.jpg"
```

Response properties

Property	Type	Description
`traceId`	`string`	Unique string id for the request.
`ok`	`boolean`	Indicates if the request was successful. Always `true` for a 200 OK response.
`error`	`{ error: string; errorMessage: string } or null`	Object containing an error enum & message if the request fails. `null` if no error occurred.
`value`	`object`	Contains the detection results.
`tensors`	`array`	List of detected objects.
`id`	`integer`	Unique identifier for each detected object.
`coordinates`	`array of integers`	Bounding box coordinates: `[x1, y1, x2, y2]` for the top-left and bottom-right corners.
`confidence`	`double`	Confidence score (0–1) indicating the certainty of the classification.
`classification`	`string`	Type of detected object. Possible values: `"SECONDARY_LESIONS"`, `"ENAMEL"`, `"DENTINE"`.
